Assignment 12 FAQs

Q1. What is namespace?

Ans- A namespace is a named scope that groups related identifiers such as functions, classes, and variable. It helps prevent naming conflicts between different parts of a program?

Q2. Why are namespaces useful in large programs?

Ans Large programs often combine code from multiple libraries or developers that may use the same names. Name spaces keep these names distinct and improve organization.

Q3 What does scope resolution operator (::) do?

Ans The scope resolution operator specifies the scope to which a name belongs. For example Arithmatic :: show() calls show() from the Arithmatic namespace.

Q4 What is the oldnamespace?

Ans The old namespace contains most of the C++ library names including cout, cin, string and vector. They can be assessed with qualified names such as std cout.

Q5 What is the difference between using declaration and using directive?

Ans A using declaration introduces one specific such as using std cout. A using directive such as using namespace std makes names from the namespace available for unqualified lookup in that scope
