Assignment - 8 FAQs

Q1. What is multiple inheritance?

Ans Multiple inheritance occurs when one derived class inherits from two or more base classes. Here, Employee inherits from Basic information to department information

Q2. How is multiple inheritance different from multilevel inheritance?

Ans In multiple inheritance, one class inherits from multiple class and its multilevel inheritance, a class inherits from a derived class, forming a chain such as A → B → C.

Q3. Why are protected members useful in inheritance?

Ans- Protected members can be accessed inside the class and its derived classes but not directly by unrelated outside code. They allow derived classes to reuse data while maintaining same access control.

Q4. What is the effect of public inheritance?

Ans- Public inheritance keeps public base-class members public in the derived class and protected members safe. It commonly refers as is-a relationship.

Q5. What ambiguity can occur in multiple inheritance, and how can it be resolved?

Ans- If both base classes contain members with the same name, the compiler may not know which one is intended. Use the scope resolution operator such as Basicinfo::display(), to specify base class.

Q6. Write a C++ program to implement single inheritance?

Ans-
```
#include <iostream>
using namespace std;
Class A {
public:
    void displayA() {
        cout << "Base Class";
    }
};
class B: public A {
};
int main() {
    B obj
    obj.displayA();
    return 0;
}
```

Q7. Write a C++ program to implement multilevel inheritance.

Ans-
```
#include<iostream>
using namespace std;
class A {
public:
    void display() {
        cout<<"Class A";
    }
};
class B: public A {
};
class C: public B {
};
int main() {
    C obj;
    obj.display();
    return 0;
}
```
