Experiment - 3 FAQs.

1. What is call by reference?
Ans: Call by reference passes a reference to the original variable rather than an independent copy. Changes made through the reference affect the original variable.

2. Why is the ampersand (&) used in swap Values() parameters?
Ans The ampersand (&) declares reference parameters such as int &x. This allows the swap function to exchange the original array elements directly.

3. What is the role of const in displayArray()?
Ans. Const indicate that the function should not modify the array elements through that parameter. It helps communicate the functions purpose and lets the compiler catch accidental changes.

4 What is the time complexity of Bubble sort?
Ans Basic bubble sort has $O(n^2)$ time complexity. because it performs repeated passes with adjecent comparisions. It's extra space complexity is O(1) when sorting in place.

5 Why is modular programming useful?

Ans It divides a larger programs into smaller functions with clear responsibilities. This makes code easier to test, understand, reuse and maintain.

6. Explain reference variables. with an example

Ans A reference variable is an alias for an existing variable. For example int x = 10, int &ref = x, ref = 20, also changes x to 20.
